

Politics

The research in H₂O and other forms of green energy, can't do without the politics. Governments has to change the law for it and make decisions about the use of it. On this site we try to give a short explanation on the way of handling of some governments.

- [The government of the Netherlands](#)
- [The politics in the world](#)

The government of the Netherlands

In the Netherlands is the subject H₂O not yet a really great item in the politic. There has been some questions, but a real debate hasn't been there. Some little proposals to make a network of gasstations for H₂O, didn't came far.

On the other hand is the issue CO₂ a big item. There are many attempts to lower the CO₂ emission. A short time ago, when the oil prices became very high, the discussion of lowering the taxes on gas became an item. But there weren't made any changes, because of the environmental consequences.

The market of green energy became recently free in Holland. This means that everyone can make their own choices about picking a energy provider. This means that the price of green energy will lower because of the competition. The government has also lower the taxes of green energy, what means that the prices of normal energy and green energy became almost equal. The normal market of energy will come also free. All these decisions needs to change the use of normal energy into green energy, and that's the best for the emission of CO₂.

The politics in the world

Worldwide are many countries working together. The goal is to reduce 'global warming'. Because of this, there were many different conferences about this. The first and most important conference, what gave a big step in the good direction, was the treaty of Kyoto. They made plans to lower the emission of CO₂. But there're still countries, like the US who doesn't want to sign the treaty, even after many confessions. Until now there isn't an agreement.
